ABBREVIATIONS, ACRONYMS & DEFINITIONS

CCDPH: Cook County Department of Public Health. Jurisdiction includes all areas in Cook County, Illinois excluding Chicago, Evanston, Oak Park, Skokie, and Stickney Township.

CDC: Centers for Disease Control and Prevention.

HIV: Human Immunodeficiency Virus, the virus that causes Acquired Immunodeficiency Syndrome (AIDS).

HP2020: Healthy People 2020. A U.S. Health and Human Services-sponsored statement of national health objectives aimed at identifying the most significant preventable threats to health and establishing national goals to reduce these threats.

MSM: Male-to-male sexual contact.

P&S SYPHILIS: Primary and secondary stages of syphilis, highly infectious stages.

STI: Sexually Transmitted Infection. Generally, this refers to chlamydia (*Chlamydia trachomatis*), gonorrhea (*Neisseria gonorrhoea*) or syphilis (*Treponema pallidum*) infection.

REPORT HIGHLIGHTS

CHLAMYDIA

- In suburban Cook County, the 2014 chlamydia rate was 413.9 per 100,000 population.
- In 2014, the majority of reported chlamydia cases were diagnosed in persons of color: 44% of cases were non-Hispanic Black and 17% were Hispanic.
- The chlamydia rate for non-Hispanic Blacks (1,114.9 per 100,000 population) in 2014 was 10 times higher than the rate in non-Hispanic Whites (113.0 per 100,000 population) and 3 times higher than the rate in Hispanics (364.1 per 100,000 population).
- Chlamydia rates were highest among females aged 20-24 years and 15-19 years, with 4,306.8 and 2,655.3 cases diagnosed per 100,000 population, respectively.

GONORRHEA

- In suburban Cook County, the 2014 gonorrhea rate was 85.0 per 100,000 population.
- The average gonorrhea rate in females aged 15-44 years was 213.0 per 100,000 population, lower, overall, than the HP2020 goal of 257.0 per 100,000 population for this age group; however, rates were not uniform and were highest in females aged 20-24 years (554.9 per 100,000 population) and in females aged 15-19 years (395.3 per 100,000 population).
- The average gonorrhea rate in males aged 15-44 years was 225.0 per 100,000 population, higher than the HP2020 goal of 198.0 per 100,000 population for this age group; like females, however, rates were not uniform and were highest in males aged 20-24 years (521.8 per 100,000 population) and unlike females, in males aged 25-29 (311.2 per 100,000 population).
- The 2014 gonorrhea rate in non-Hispanic Blacks (348.7 per 100,000 population) was 25 times higher than the gonorrhea rate in non-Hispanic Whites (14.1 per 100,000 population) and nearly 10 times higher than the rate in Hispanics (36.2 per 100,000 population).

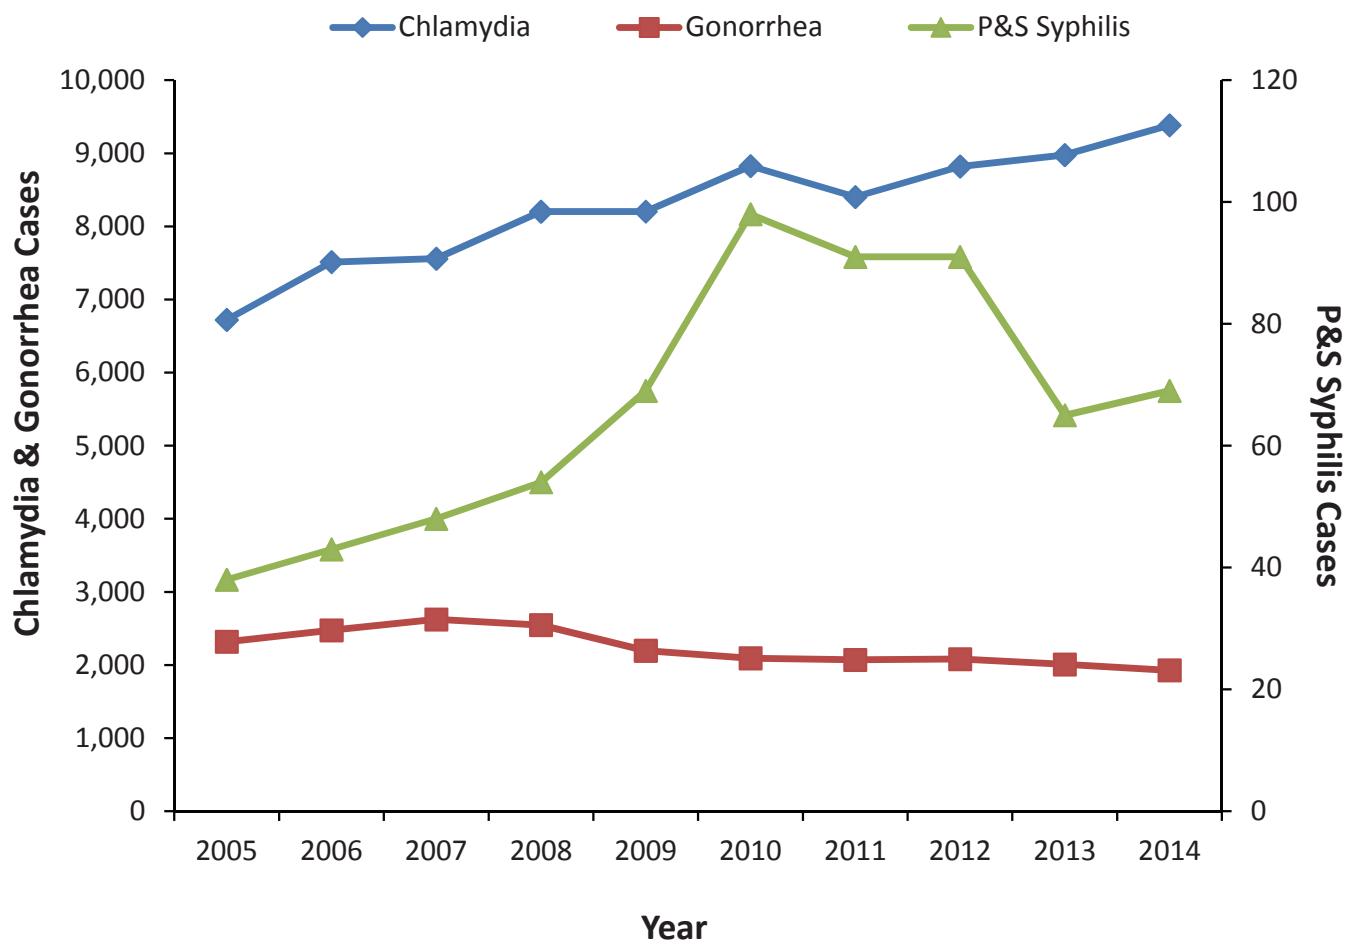

PRIMARY AND SECONDARY (P&S) SYPHILIS

- In suburban Cook County, the 2014 P&S syphilis rate was 3.0 per 100,000 population.
- In 2014, 88% of P&S syphilis cases were male, corresponding to a rate of 5.6 per 100,000 population, lower than the HP2020 goal of 6.8 per 100,000 population; the P&S syphilis rate in females was 0.7 per 100,000 population, below the HP2020 goal of 1.5 per 100,000 population.
- In 2014, 58% of reported P&S syphilis cases were non-Hispanic Black; 22% were non-Hispanic White and 17% were Hispanic.

Table 1. Number and Rates (per 100,000 population) of Reported Chlamydia, Gonorrhea and P&S Syphilis Cases by Year, Suburban Cook County, 2010-2014

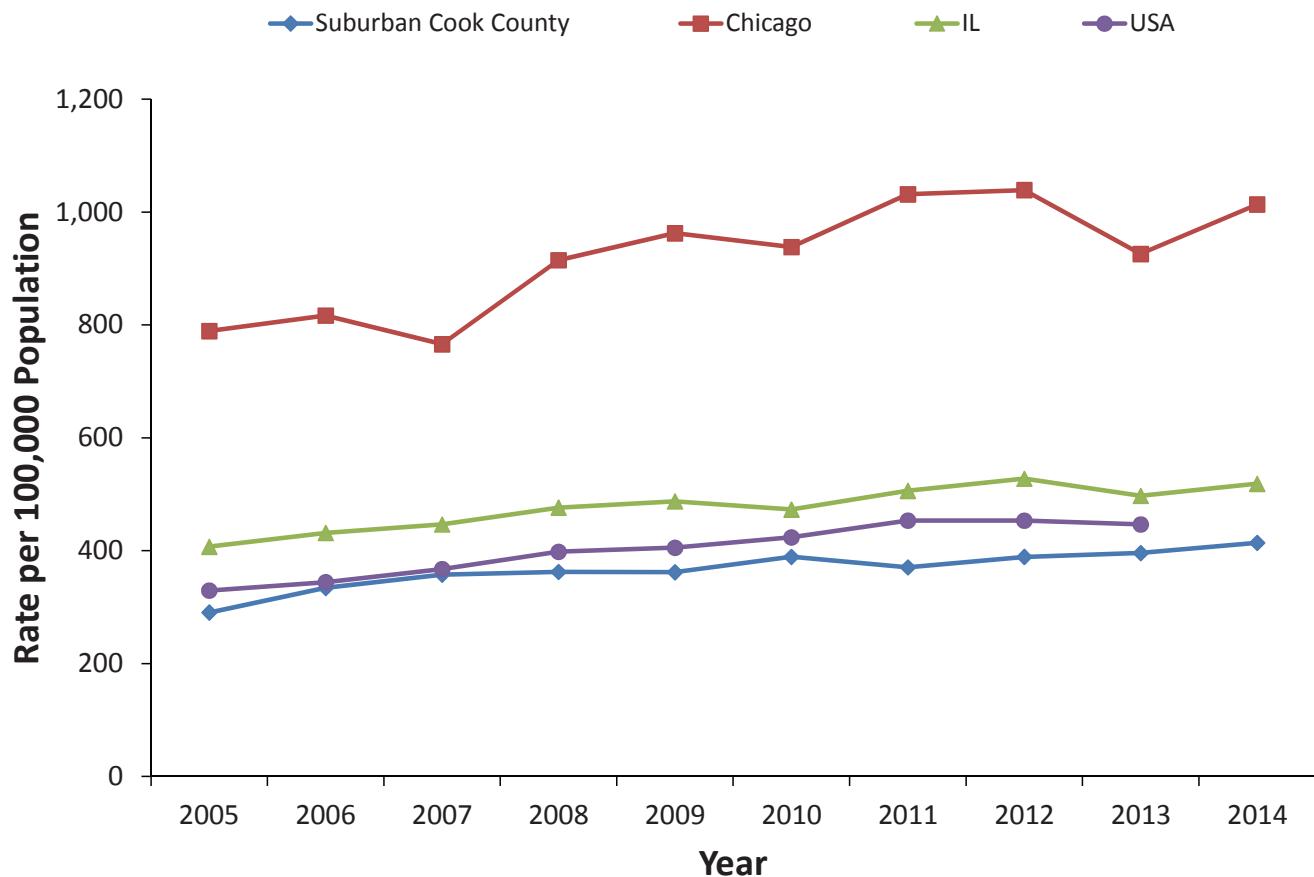

Disease	2010		2011		2012		2013		2014		5-Year Median	
	No.	Rate*	No.	Rate*

Gonorrhea	2,093	92.3	2,071	91.3	2,081	91.8	2,009	88.6	1,928	85.0	2,071	91.3
P&S Syphilis	98	4.3	91	4.0	91	4.0	65	2.9	69	3.0	91	4.0

Figure 1. Trends in the Number of Reported Chlamydia, Gonorrhea and P&S Syphilis Cases, Suburban Cook County, 2005-2014

▲Figure 1. Between 2005-2014, the number of chlamydia cases increased 40%, from 6,722 cases in 2005 to 9,384 cases in 2014. In 2014, 1,928 cases of gonorrhea were reported, a 27% decline since the peak in 2007. P&S syphilis cases increased dramatically between 2005 (n=38) and 2010 (n=98), an increase of 158%. P&S syphilis cases declined from 98 in 2010 to 69 in 2014, a 30% decline.

Figure 2. Trends in Chlamydia Rates (per 100,000 population) by Selected Public Health Jurisdictions, 2005-2014

▲**Figure 2.** Rates of chlamydia in suburban Cook County, in Illinois, and in the United States have increased between 2005 and 2014. In 2014, the rate of Chlamydia in Chicago (1,013.5 per 100,000 population) was more than 2 times higher than the rate in suburb Cook County (413.9 per 100,000 population). In 2014, the rate of chlamydia in suburban Cook County was also lower than the rates of the United States and Illinois, 446.6 and 518.6 per 100,000, population respectively.

*Incident rates calculated per 100,000 population based on 2010 estimates of the population (U.S. Census Bureau).

†Rates not calculated for n<5

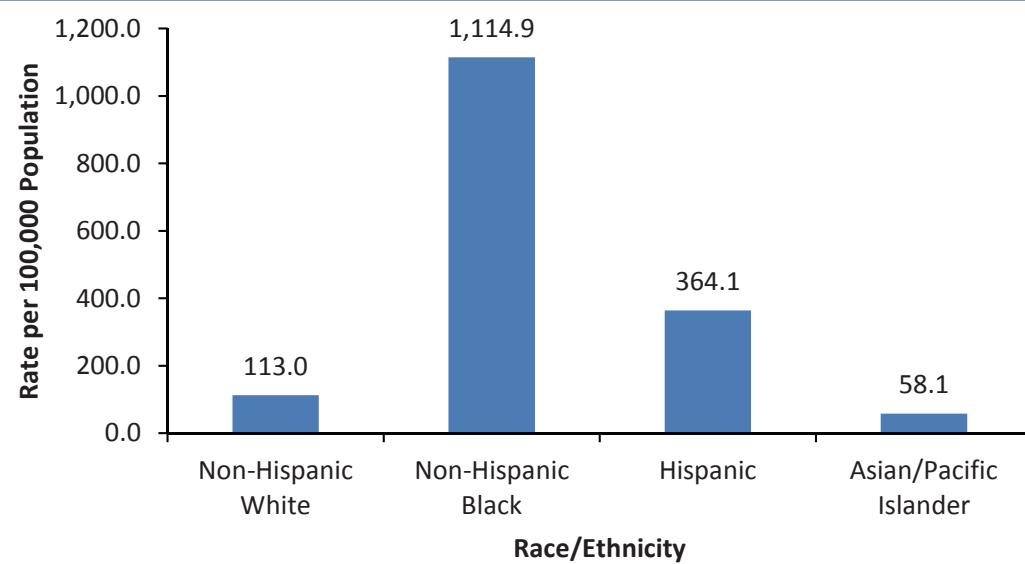

▲ Table 2. Sex: Between 2012 and 2014, more than 70% of reported chlamydia cases were female. **Age Groups:** In 2014 68% of reported chlamydia cases were 15-24 years of age. **Race/Ethnicity:** In 2014, 44% of reported chlamydia cases were non-Hispanic Black. In 2014, the rate of chlamydia in non-Hispanic Blacks (1,114.9 per 100,000 population) was 3.0 times higher than the rate in Hispanics (364.1 per 100,000 population), 10 times higher than the rate in non-Hispanic Whites (113.0 per 100,000 population), and 19 times higher than the rate in Asian/Pacific Islanders (58.1 per 100,000 population). **District:** Chlamydia rates were highest in the South District (850.4 per 100,000 population) followed by the West district (465.3 per 100,000 population).

Figure 3. Chlamydia Rates (per 100,000 population) by Sex and Age Groups (Years), Suburban Cook County, 2014

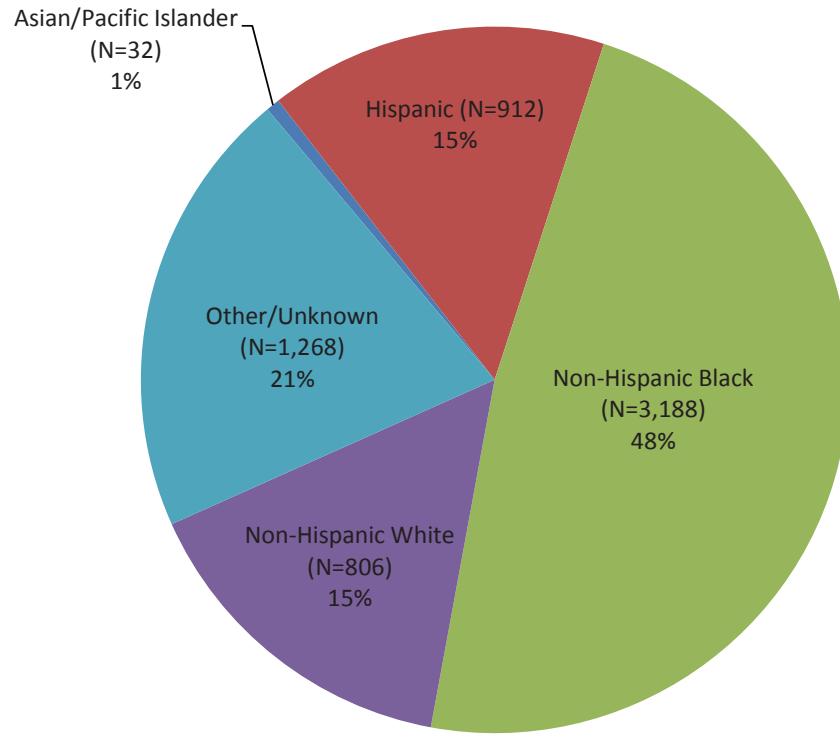

◀**Figure 3.** The chlamydia rates for both males and females were highest in the 20-24 year old age group, though the rate in females was 3 times higher than the rates in males. Among those aged 15-19 years, the rate in females was almost 4 times greater than the rate in males.

Figure 4. Chlamydia Rates (per 100,000 population) by Race/Ethnicity, Suburban Cook County, 2014

►**Figure 4.** The 2014 chlamydia rate in non-Hispanic Blacks was 3 times higher than the rate in Hispanics, 10 times higher than the rate in non-Hispanic Whites, and nearly 19 times higher than the rate in Asian/Pacific Islanders.

Figure 5. Proportion of Chlamydia Cases Among Persons Aged 15-24 Years
by Race/Ethnicity, Suburban Cook County, 2014

▲Figure 5. In 2014, a majority of chlamydia cases reported in youth (persons aged 15-24 years) were non-Hispanic Black (48%); 15% were Hispanic, 15% were non-Hispanic White, and 1% were Asian/Pacific Islanders.

Figure 6. Chlamydia Rates (per 100,000 population) by Municipality (Suburban Cook County) or Community Area (Chicago), 2014

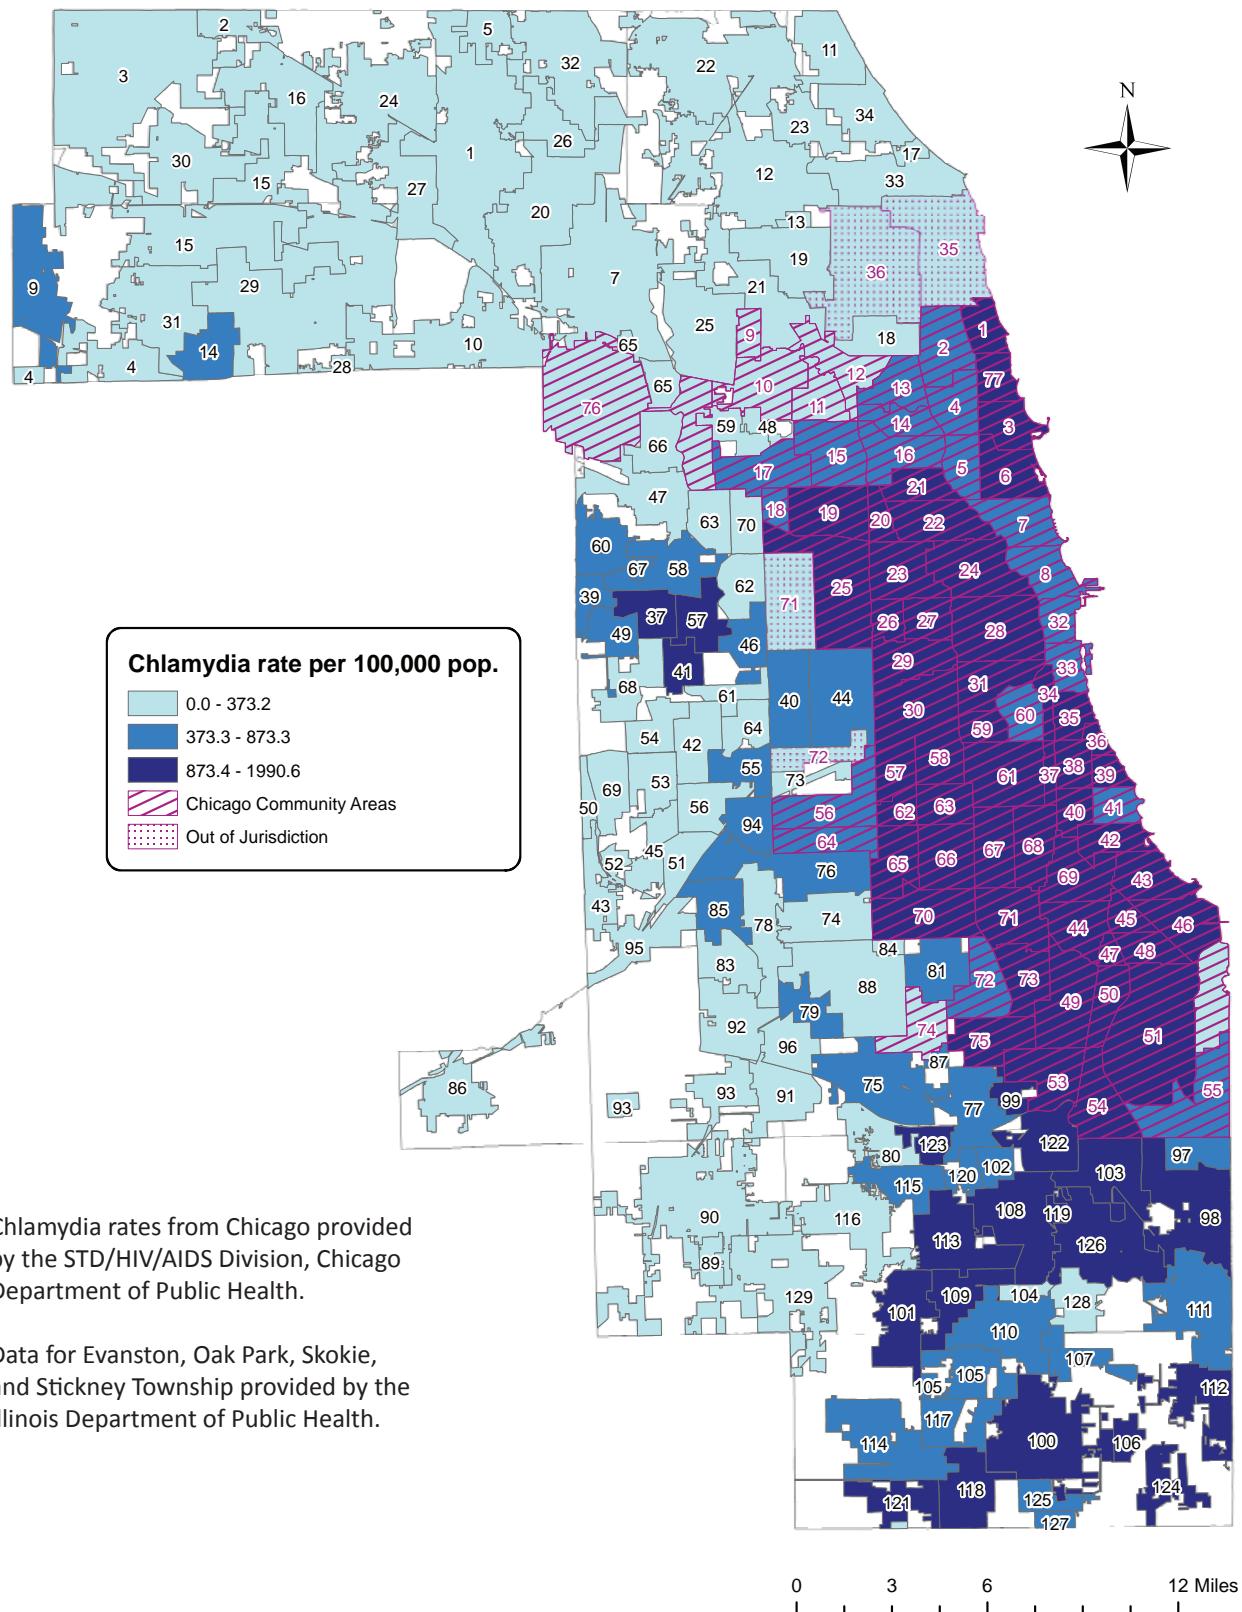

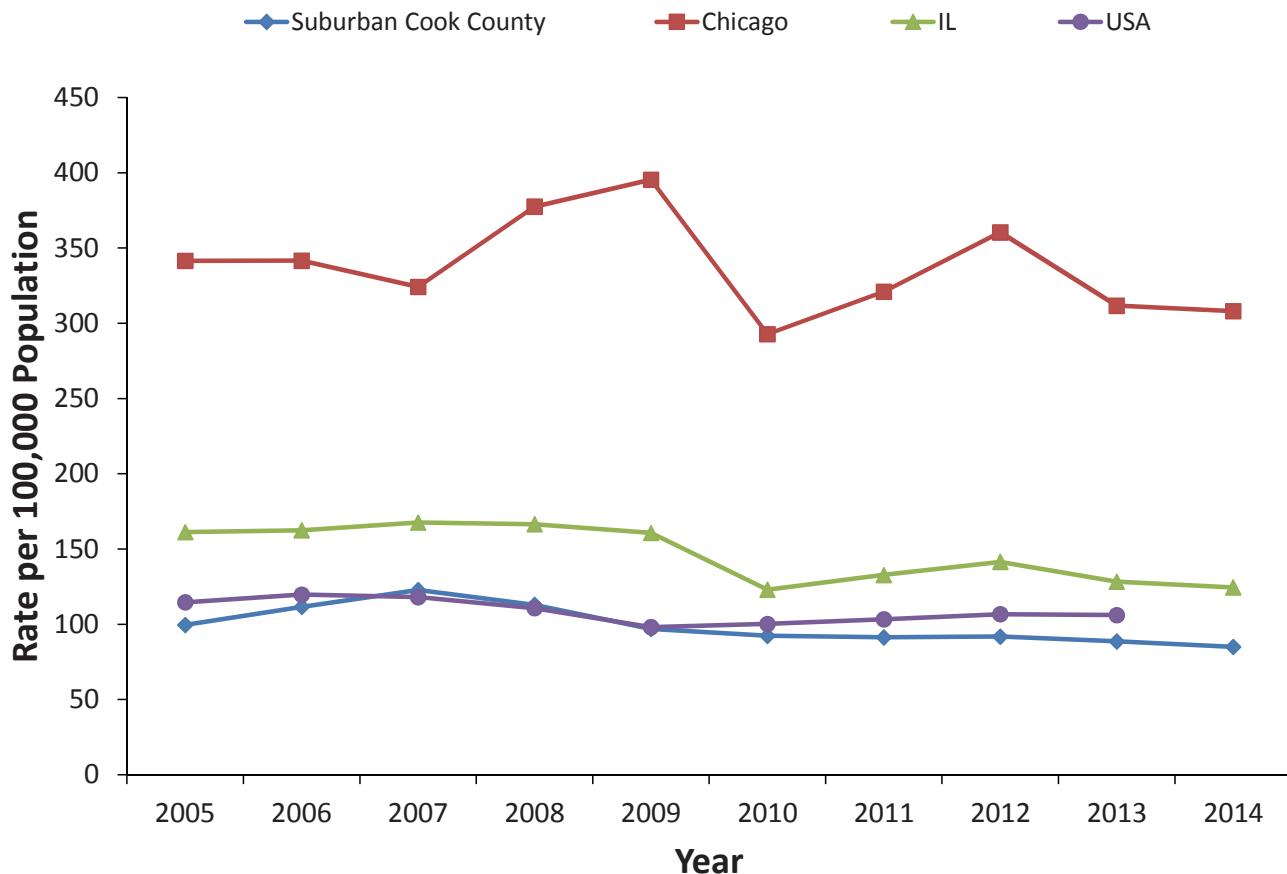

Figure 7. Trends in Gonorrhea Rates (per 100,000 population) by Selected Public Health Jurisdictions, 2005-2014

▲**Figure 7.** Since 2007, gonorrhea rates in suburban Cook County have been on the steady decline and were slightly lower compared to rates in the United States. In 2014, the gonorrhea rate in suburban Cook County was 85.0 per 100,000 population. The 2014 gonorrhea rates in Illinois and Chicago were 124.5 and 308.1 per 100,000 population, respectively.

*Incident rates calculated per 100,000 population based on 2010 estimates of the population (U.S. Census Bureau).

†Rates not calculated for n<5

▲Table 3. Sex: Between 2012 and 2014, 51% of reported gonorrhea cases were female. **Race/Ethnicity:** in 2014, 67% of gonorrhea cases were in non-Hispanic Blacks; 10% were non-Hispanic White and 8% were Hispanic. The 2014 gonorrhea rate in non-Hispanic Blacks was 348.7 per 100,000, 25 times higher than the rate in non-Hispanic Whites (14.1 per 100,000 population) and nearly 10 times higher than the rate in Hispanics (36.2 per 100,000 population). **Age Groups:** As with chlamydia, the majority (61%) of cases were 15-24 years of age. **District:** In 2014, 57.2% of gonorrhea cases were diagnosed in the South District and 21.6% were diagnosed in the West District. The South and West districts also had the highest gonorrhea rates in 2014 (233.8 and 82.7 per 100,000 population, respectively).

► **Figure 8.** As was the case with chlamydia rates, gonorrhea rates were highest in persons aged 15-24 years of age. Females aged 20-24 years had the highest gonorrhea rate in 2014 (554.9 per 100,000 population), followed by females 15-19 years of age (395.3 per 100,000 population). The average rate in females aged 15-44 years of age was 213.0 per 100,000 population, lower, overall, than the HP2020 goal of 257.0 per 100,000 population in this age group. Among males, those aged 20-24 years had the highest gonorrhea rate (521.8 per 100,000 population), followed by males aged 25-29 years (311.2 per 100,000 population). The average rate in males aged 15-44 years was 225.0 per 100,000 population, higher, overall, than the HP2020 goal of 198.0 per 100,000 population in this age group.

Figure 8. Gonorrhea Rates (per 100,000 population) by Sex and Age Groups (Years), Suburban Cook County, 2014

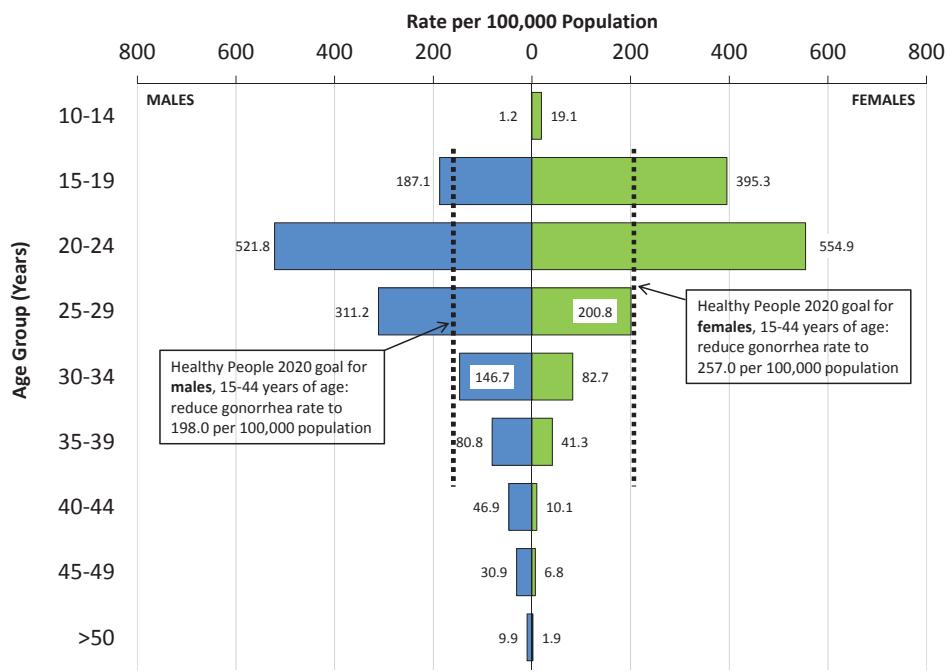

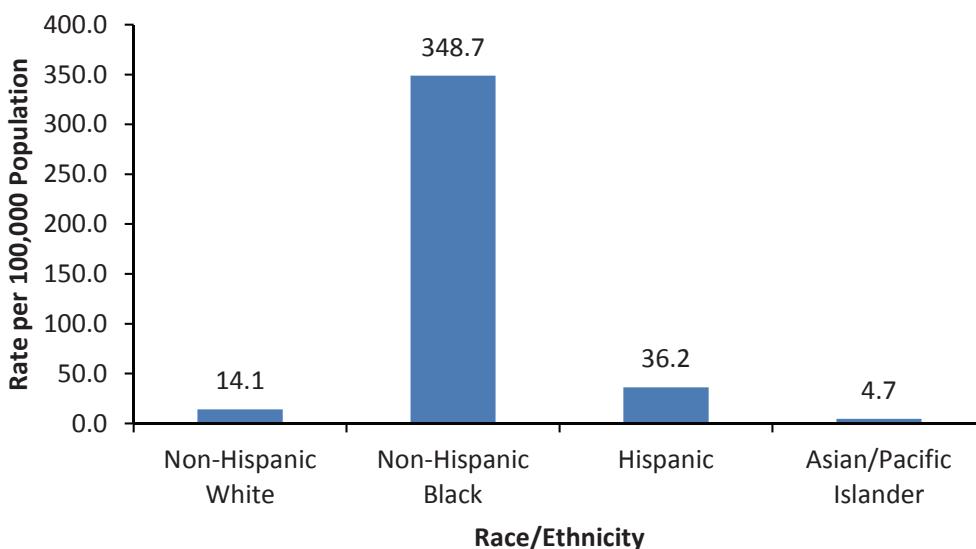

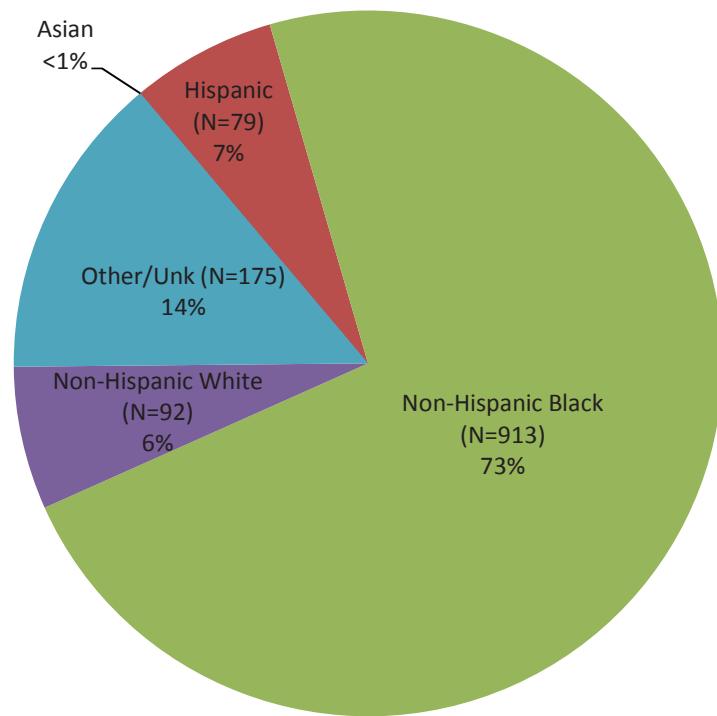

Figure 9. Gonorrhea Rates (per 100,000 population) by Race/Ethnicity, Suburban Cook County, 2014

◀ **Figure 9.** The 2014 gonorrhea rate in non-Hispanic Blacks was 348.7 per 100,000, 25 times higher than the rate in non-Hispanic Whites (14.1 per 100,000 population) and nearly 10 times higher than the rate in Hispanics (36.2 per 100,000 population).

Figure 10. Proportion of Gonorrhea Cases Among Persons Aged 15-24 Years by Race/Ethnicity, Suburban Cook County, 2014

▲**Figure 10.** Among gonorrhea cases reported in 2014 who were 15-24 years of age, 73% were non-Hispanic Black, 7% were Hispanic, 6% were non-Hispanic White and less than 1% were Asian/Pacific Islanders.

Figure 11. Gonorrhea Rates (per 100,000 population) by Municipality (Suburban Cook County) or Community Area, Chicago, 2014

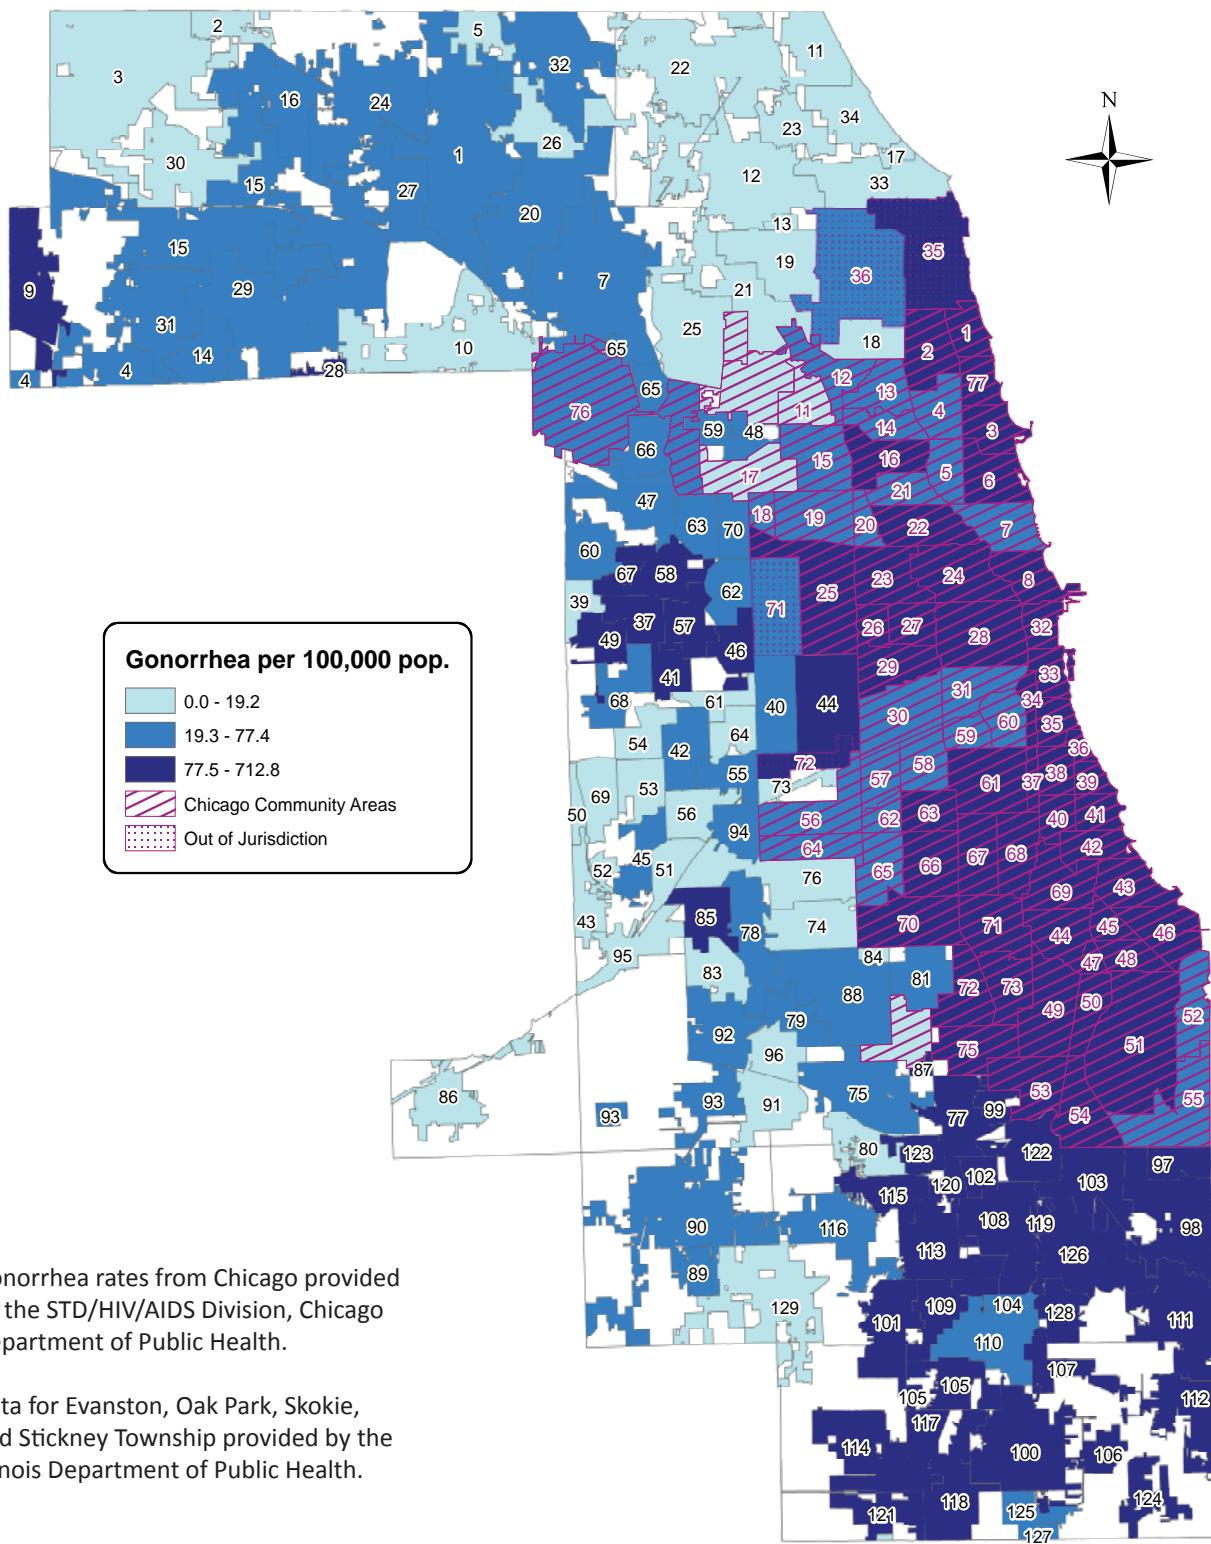

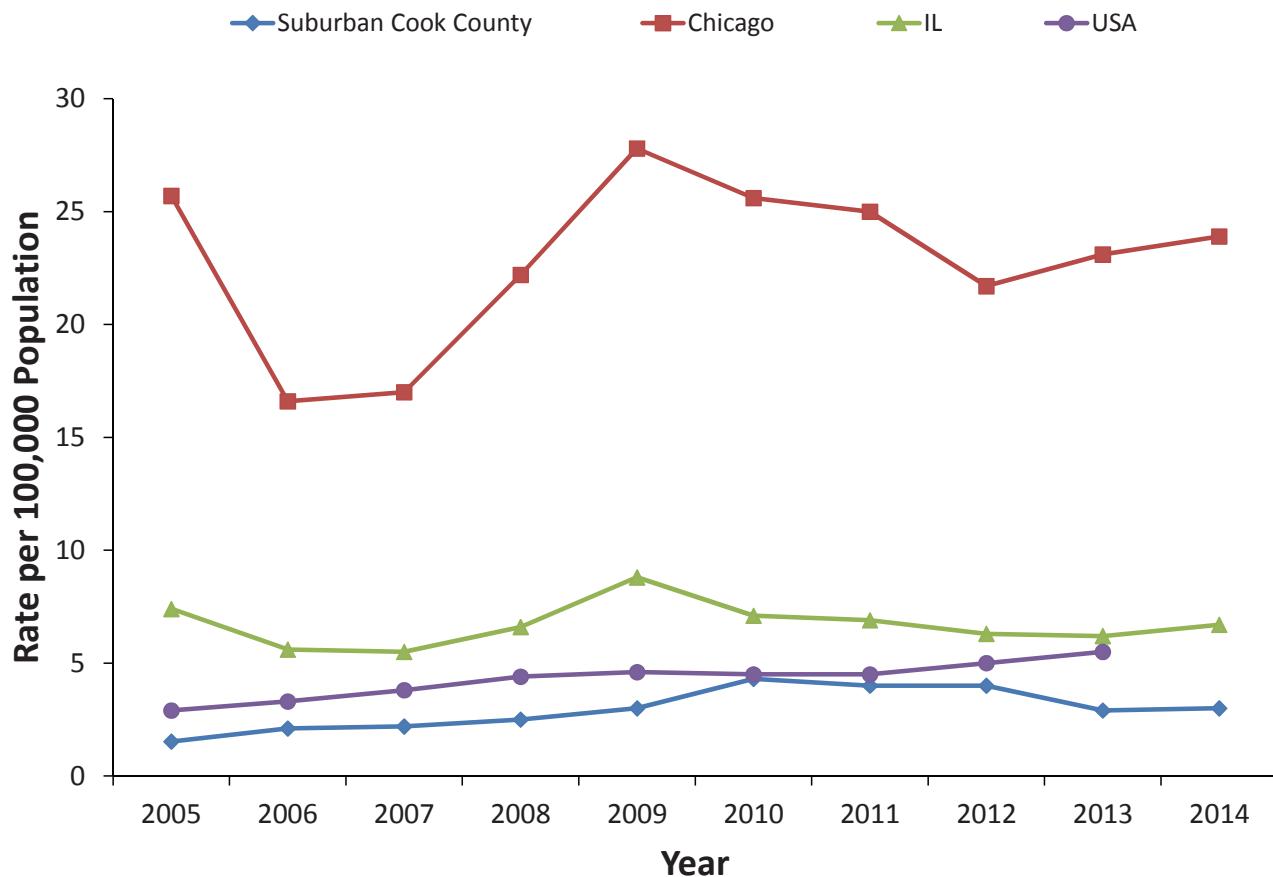

Figure 12. Primary and Secondary Syphilis Rates (per 100,000 population) by Selected Public Health Jurisdictions, 2005-2014

▲Figure 11. Between 2005-2014, rates of primary and secondary (P&S) syphilis in suburban Cook County were typically lower than the rates in the US overall, lower than the rates in Illinois and lower than the rates in Chicago. In 2014, the rate of P&S syphilis in suburban Cook County was 3.0 per 100,000 population. The P&S syphilis rate in Illinois was 6.7 per 100,000 population. Chicago had the highest P&S syphilis rate at 23.9 per 100,000 population, 8 times higher than the rate in suburban Cook County. In suburban Cook County and in Chicago, P&S syphilis rates remained relatively the same from 2013 to 2014.

*Incident rates calculated per 100,000 population based on 2010 estimates of the population (U.S. Census Bureau).

†Congenital syphilis rates calculated per 100,000 live births (taken from IDPH 2010 vital statistics).

†Rates not calculated for n<5

► **Table 4. Syphilis Stage:** Between 2013 and 2014, approximately a fourth of cases were classified as P&S syphilis. **Sex:** Among P&S syphilis cases in 2014, the overwhelming majority of cases were males (88%). The P&S syphilis rate in males in 2014 was 5.6 per 100,000 population, lower than the HP2020 goal for males (6.8 per 100,000 population). The P&S syphilis rate in females in 2014 was 0.7, lower than the HP2020 goal of 1.5 per 100,000 population. **Race/Ethnicity:** In 2014, 58% of reported P&S syphilis cases were non-Hispanic Black. **District:** Nearly 44% of all P&S syphilis cases reported living in the South District and 20% reported living in the West District. The rate of P&S syphilis in the South District was 6.4 per 100,000, more than double the 2014 average rate in suburban Cook County (3.0 per 100,000 population).

Figure 13. Proportion of P&S Syphilis Cases by Race/Ethnicity and Year of Report,
Suburban Cook County, 2012-2014

▲ **Figure 13.** Among P&S syphilis cases reported in suburban Cook County in 2014, 58% were non-Hispanic Black, 22% were non-Hispanic White and 17% were Hispanic.

TECHNICAL NOTES

Cook County Department of Public Health Jurisdiction

The jurisdiction of the Cook County Department of Public Health includes all municipalities and portions within Cook County, except for Chicago, Evanston, Oak Park, Skokie and Stickney Township, each of which has its own state-certified local health department. Throughout this report, the term, “suburban Cook County” refers to CCDPH’s jurisdiction with the exceptions noted above.

Data Methodology

Medical providers and laboratories within suburban Cook County are required by law to report positive cases of chlamydia, gonorrhea, and syphilis to the Cook County Department of Public Health within 7 days of diagnosis. These case reports are then entered into a secure database and forwarded to the Illinois Department of Public Health, providing the basis for the information presented in this report. Incidence rates were calculated using population estimates from the U.S. Census Bureau (2010 Census).

Data Limitations

This report includes all reported cases of chlamydia, gonorrhea, and syphilis, but does not represent the entire population of persons infected because not all infected persons have been tested or reported. Frequently, there is a considerable lag between the time a person is diagnosed with an STI and the time the local health department receives the report. Additionally, persons with asymptomatic STIs, such as chlamydia, may be underrepresented in surveillance reports because many such individuals may not seek care, may remain undiagnosed, and, consequently, unreported.
