ABBREVIATIONS, ACRONYMS & DEFINITIONS

CCDPH: Cook County Department of Public Health. Jurisdiction includes all areas in Cook County, Illinois excluding Chicago, Evanston, Oak Park, Skokie, and Stickney.

CDC: Centers for Disease Control and Prevention

HIV: Human Immunodeficiency Virus

HIV (any Stage): A person with HIV infection who may have progressed to AIDS; equivalent to “HIV or AIDS.”

HIV (not AIDS): A person infected with HIV who has not yet progressed to AIDS.

IDU: Injection drug use.

MSM: Male-to-male sexual contact.

PLWHA: Person(s) living with HIV or AIDS

STI: Sexually Transmitted Infection. Generally, this refers to chlamydia (*Chlamydia trachomatis*), gonorrhea (*Neisseria gonorrhoea*) or syphilis (*Treponema pallidum*) infection.

EXECUTIVE SUMMARY

- AIDS diagnoses increased for the second straight year, rising from 58 cases in 2011 to 92 cases in 2013, an increase of 57%.
- The number of persons living with HIV (any stage) increased 87% from 2,500 in 2004 to 4,683 in 2013.
- HIV-related deaths declined from 66 in 2004 to 16 in 2013.
- Males are disproportionately affected by HIV. Since the beginning of the HIV/AIDS epidemic (June, 1981), 75% of all cases diagnosed in suburban Cook County were male. In 2011, the ratio of males to females diagnosed with HIV (any stage) was 4:1.
- More than half of all new HIV (not AIDS) diagnoses between 2004 and 2013 were in non-Hispanic Blacks. In suburban Cook County, non-Hispanic Blacks represent only 14% of the general population.
- Seventy-two percent (72%) of females diagnosed with HIV (not AIDS) between 2011 and 2013 were non-Hispanic Black.
- Among males, 75% of new HIV (not AIDS) cases diagnosed between 2011-2013 were among men who have sex with men (MSM).
- Among females, nearly 96% of new HIV diagnoses between 2011 and 2013 were a result of heterosexual transmission.
- The prevalence of HIV/AIDS was highest in the South District (298.9 cases per 100,000 population), followed by the West District (230.0 cases per 100,000 population).

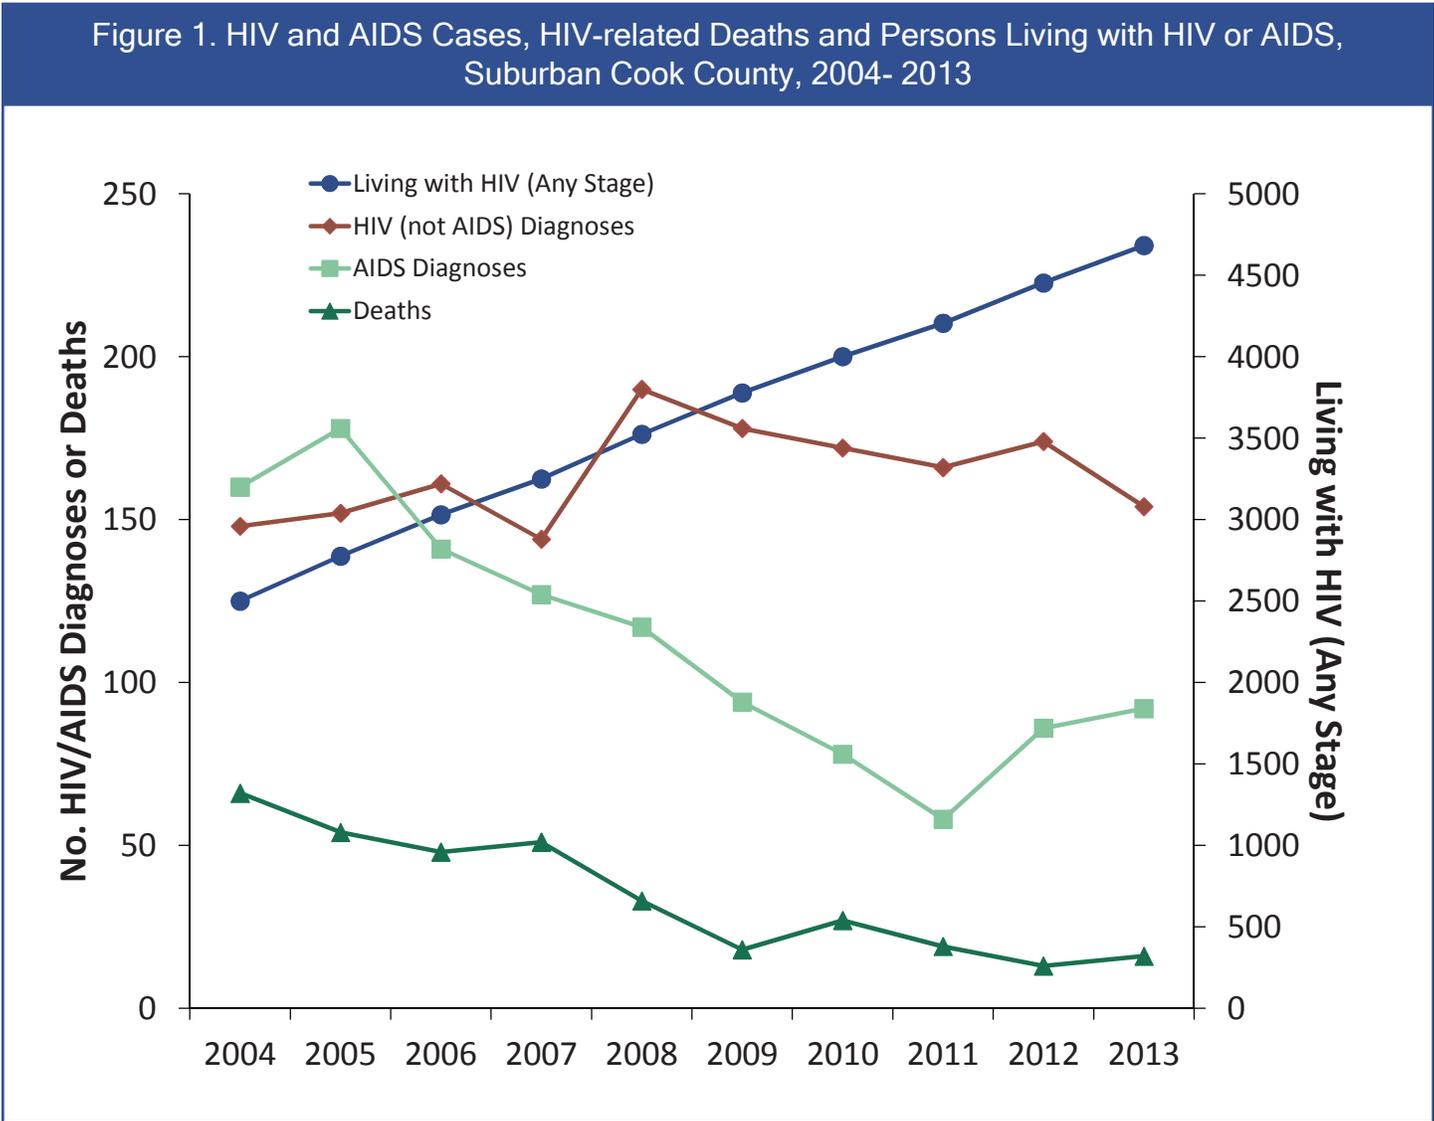

Figure 1. New AIDS diagnoses increased 59%, from 52 cases in 2011 to 92 cases in 2013.

HIV-related deaths declined 76% between 2004 (n=66) and 2013 (n=16).

The number of PLWHA increased 87% from 2,500 in 2004 to 4,683 in 2013. PLWHA increased at an average rate of 218 per year between 2004 and 2013.

* Cells with small sample sizes have been suppressed. See Technical Notes Section.

† Preliminary data. Counts may change as new cases are reported.

¶ Since the beginning of the epidemic (June, 1981) through the end of 2009.

§ Persons with unknown modes of transmission were imputed using a hot-deck algorithm. See Technical Notes.

** Includes perinatal transmission and transmission resulting from HIV-infected blood products (including persons with hemophilia).

Table 1 - Sex: Since the beginning of the HIV/AIDS epidemic (June, 1981), through the end of 2013, 78% of all HIV cases diagnosed were male and 22% were female.

Age Groups: The proportion of cases aged 20-29 years increased from 20% in 2004 to 36% in 2013.

Race/Ethnicity: Between 2004-2012, non-Hispanic blacks accounted for over 50% of cases. In 2013, non-Hispanic whites accounted for almost half of new cases.

Mode of Transmission: The predominant mode of transmission overall has been male-to-male sexual contact. The proportion of cases attributed to MSM decreased between 2009 and 2013, from 60% to 50%, respectively. During the same time, the proportion of cases who were injection drug users more than doubled from 7% in 2009 to 15% in 2013.

¶ Total includes Asian/Pacific Islander, Other and Unknown Race/ethnicity

§ Persons with unknown modes of transmission were imputed using a hot-deck algorithm. See Technical Notes.

** Includes perinatal transmission and transmission resulting from HIV-infected blood products (including persons with hemophilia).

Table 2: Among those persons living with HIV/AIDS through 2013, 49% were non-Hispanic Black, 32% were non-Hispanic White, and 13% were Hispanic.

Seventy-six percent (76%) of PLWHA through 2013 were males and 24% were females.

Seventy-one percent (71%) of males living with HIV acquired infection as a result of male-to-male sexual contact.

Seventy-six percent (76%) of females living with HIV acquired infection as a result of heterosexual contact.

† Preliminary data. Counts may change as new cases are reported.

¶ Persons with unknown modes of transmission were imputed using a hot-deck algorithm. See Technical Notes.

§ Includes perinatal transmission and transmission resulting from HIV-infected blood products (including persons with hemophilia).

Table 3: Between 2011 and 2013, 54% of all recently diagnosed HIV (not AIDS) cases in suburban Cook County were non-Hispanic Blacks. Of those, 75% were males and 25% were females. Among all females newly diagnosed with HIV (not AIDS) between 2011 and 2013, 71% were non-Hispanic Black. The leading mode of HIV (not AIDS) transmission among all females was heterosexual contact (97%).

Among males diagnosed with HIV (not AIDS) between 2011 and 2013, 75% acquired infection as a result of male-to-male sexual contact.

Non-Hispanic Blacks were disproportionately affected by HIV. More than half of all HIV (not AIDS) diagnoses made between 2011-2013 were in non Hispanic Blacks, who represent only 14% of the general population of suburban Cook County.

TECHNICAL NOTES

Surveillance Methodology

Healthcare providers and laboratories within suburban Cook County are required to report positive cases of HIV to the Cook County Department of Public Health within 7 days of diagnosis. These case reports are then entered into a secured database as new cases or as updates to existing cases. These data are analyzed and provide the basis for the information presented in this report.

This report includes all reported cases of HIV or AIDS through August 2, 2014. These data do not represent the entire population of persons infected with HIV nor PLWHA as not all persons with HIV have been tested or reported. The Centers for Disease Control and Prevention estimates that approximately 21% of persons infected with HIV are unaware of their status (1). In addition, there is often a lag (sometimes considerable) between the time a person is diagnosed with HIV infection and the time the local health department obtains the report, despite the requirement that providers and laboratories report within 7 days. Also, case counts change year to year as new reports are submitted and as databases at the local, state, and national levels are deduplicated. These are all important caveats to consider when interpreting HIV/AIDS data.

Data Presentation and Confidentiality

Small cells (representing 1-4 cases) have been suppressed in order to protect the confidentiality of persons diagnosed with HIV or AIDS or PLWHA, except for data presented in Figure 2.

Hot-Deck Imputation

Hot-deck imputation is a method to deal with missing values that occur in a dataset. The basic idea behind hot-deck imputation is to replace a missing value with a non-missing value from a similar record.
